

Sterling Holidays Ten-Agent Report

A concise assessment of the complete SEO/AEO agent suite using sterlingholidays.com and the Sterling Kodai - Lake priority page.

7.5/10	10/10	126
Overall quality	Agents completed	Tests passed

Executive assessment

All ten agents completed persisted live runs. The suite is effective as an analyst's first-pass workbench with human review. It is not ready for unsupervised client publishing because several scores are heuristic, crawl coverage is partial, and some recommendations still require editorial judgement.

Most important Sterling findings

- Confirmed 404 at [/resorts-hotels/corbett](#).
- Malformed JSON-LD on three sampled pages.
- Site-wide navigation dominates the sampled link graph: 182 observed edges, but only 15 contextual edges.
- The Kodai - Lake page has 14 images with missing alt attributes and does not use the exact evaluation phrase.

Evaluation boundary

The keyword **resorts in Kodaikanal**, audience, and campaign goal are evaluation fixtures. They are not presented as Sterling's approved strategy. Business facts came only from Sterling's public page; prices, live availability, ratings, hours, and coordinates were withheld.

AGENT SCORECARD

How each agent performed

Agent	Result	Rating	Run
SEO/AEO Audit	20 pages; score 68; 9 grouped findings	8.5/10	f4bc4176
AI Visibility	10 pages; readiness 93; 3 findings	7.5/10	13edfdc3
Internal Linking	15 pages; 4 retained opportunities	7.5/10	fba5007c
SERP & Competitor	8 results; 2 of 5 pages inspected	7.5/10	284e3706
Content Brief	Score 77; handoff correctly withheld	6.5/10	4ddc2ebe
Keyword Clustering	15 seeds; 4 clusters; no volume data	7.0/10	722541c4
Metadata	4 titles; 3 descriptions; selection needs review	7.0/10	2308470f
Schema Markup	Valid LodgingBusiness draft	8.0/10	c1ab6697
Local SEO	One grounded needs-review page	7.0/10	57147714
Content Optimizer	2,320 words; score 64; 11/13 checks	7.5/10	2358ef1a

Quality judgement

The strongest outputs were evidence-backed technical findings, conservative schema generation, and transparent crawl limitations. The weakest point was the Content Brief: it completed but failed its own handoff validation. Metadata, clustering, local copy, and contextual links are usable drafts that still need campaign-owner or editor approval.

Pipeline handoff

The Content Optimizer retained both the saved SERP and Content Brief run IDs. The wider chain remains partial because the Brief, Metadata, and Schema agents cannot yet consume upstream runs directly.

RECOMMENDATION

What to fix next

Defects found and corrected during testing

Content extraction

A one-word shell produced a false optimizer result. The extractor now falls back to substantial body content. The live rerun increased observed copy from 1 to 2,320 words.

Resort schema

LodgingBusiness support was added to the Schema Generator. The corrected live run emitted the appropriate resort type using supplied facts.

Local page schema

Physical accommodation businesses now emit LodgingBusiness instead of generic LocalBusiness.

Priority Sterling work queue

1. Restore or redirect the confirmed Corbett 404.
2. Repair malformed JSON-LD and validate the rendered pages.
3. Review missing image alternatives, separating informative and decorative images.
4. Confirm the target keyword and intent before changing copy or metadata.
5. Regenerate the Content Brief until it passes handoff validation.
6. Review contextual links and keyword clusters for relevance and cannibalization.
7. Validate the final LodgingBusiness markup after integration.

Decision: Use the suite for research, prioritization, and draft generation with human approval. One live site is not the mentor's full benchmark; that still requires 50-100 distinctly reviewed pages across 5-10 sites, issue-level accuracy labels, and rendered desktop/mobile review.
